Your kitchen is on stock, you can take it home already today.

Are you planning a new kitchen?

For successful planning of your kitchen you need to accurately **measure the room and installations** (in mm or cm).

If you are not the handy type, don't worry, you can also order it as a paid service.

1. length of wall/space for kitchen
2. location of electric inlets, switches and sockets (height from floor, distance from corners, doors etc.)
3. location of electric inlets, switches and sockets (height from floor, distance from corners, doors etc.)
4. location of water inlet and drainpipes
5. location of gas plumbing and valve
6. location of windows and doors (width, height, height of the window sill)
7. location of heating/radiator (width, depth, from where the pipes lead)

If there are any other installations in the space, where you want to place your kitchen, such as water pipes, heating pipes etc., it is also necessary to know their location (height from the floor, distance from wall ...).
